

## How it all works

### Signing

### Verifying

### The Blockchain

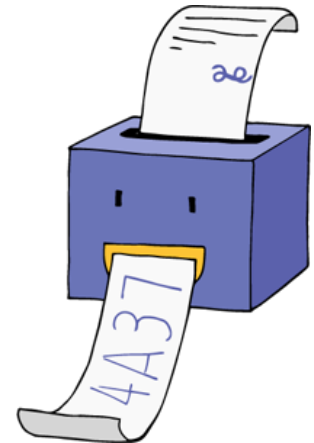

BlockSign allows you to sign any document.

To sign something, you upload your document and add your signature, which we call a signature stamp. Your signature stamp includes your name and email address. If other people need to sign your document, they are asked to do the same with their signature stamp.

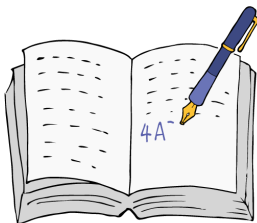

Your document along with its new signature stamps is then given to our robot.

Our robot loves cryptography. It takes your document and turns it into a single 32-digit string of letters and numbers.

That string of 32 digits is then written into a record book called the blockchain.

Written next to the string is a "From:" address which is connected to your account on BlockSign, so that it is clear who signed what documents.
